The invention relates to a method of detecting human immunodeficiency virus-2 nucleic acids (NA) in a biological sample, by contacting NAs with 1st and 2nd amplification oligonucleotides, amplifying HTV-2 nucleotide base sequence, and detecting the amplified NA; or providing a hybridisation probe and detectable label, hybridising HTV-2 NA with the probe to form probe:target duplex, and detecting the duplex. The method is useful for detecting the presence of HTV-2 NAs in a lysate or a blood product such as plasma or serum, and also for detecting subtypes A, B, C

Detecting human immunodeficiency virus-2 nucleic acids in a sample, by amplifying nucleic acids with oligonucleotides and detecting nucleic acid, or hybridizing nucleic acid with a probe and detecting probe:target

AAF56540
                                                                                          The present invention provides probes and PCR primers for use in the detection of HIV-1. These are shown in AAF56533-AAF56589. They can used to diagnose HIV infection and to ensure that blood and blood products do not contain the virus, thus enabling the prevention of infection during blood transfusions.                                              The invention relates to a method of detecting human immunodeficiency virus-2 nucleic acids (NA) in a biological sample, by contacting NAs with 2C last and 2nd amplification oligonucleotides, amplifying HIV-2 nucleotide to base sequence, and detecting the amplified NA, or providing a CC probe to form probe and detectable label, hybridisally HIV-2. NA with the CC probe to form probe:target duplex, and detecting the duplex. The method is useful for detecting the presence of HIV-2. NAs in a lysate or a blood CC product such as plasma or serum, and also for detecting subtypes A, B, C CC and D of HIV-2. The method is useful for amplifying and detecting the NA CC reactions that synthesise amplicons corresponding to polynucleotides of CC unrelated viruses, e.g. HIV-1, hepatitis B virus (HBV) and hepatitis C CC virus (HCV). ABK93977-ABK93910 represent HIV-2 detection probes of the vv
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          밁

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention provides probes and PCR primers for use in the detection of HIV-1. These are shown in AAF56533-AAF56589. They can be used to diagnose HIV infection and to ensure the blood and blood products do not contain the virus, thus enabling the prevention of HIV infection during blood transfusions.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            AAV66330-31 represent Human immunodeficiency virus region 1 primers. The primers are used to exemplify the invention, together with probe AAV66332. The specification describes methods of synthesising multiple copies of a target nucleic acid sequence autocatalytically under conditions of substantially constant temparature, ionic strength and pH are provided in which multiple RNA copies of the target sequence autocatalytically generate additional copies. The target sequence is a block splice template which comprises two nucleic acid regions. The first region is located 3' of the second region and is blocked at its 3' terminus to inhibit primer extension by a DNA polymerase, and the second region comprises a promoter sequence recognised by an RNA polymerase. The methods are used for amplify nucleic acide agencially bun for arealwais.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Sequence 53 BP; 15 A; 11 C; 13 G; 14 T; 0 U; 0 Other;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Block splice template useful for amplification of nucleic acids - comprises two nucleic acid regions, the first region located 3' of the second region and blocked at its 3' terminus to inhibit primer extension

The present sequence is a primer for the human immunodeficiency virus region 1, which was used to demonstrate an improved method for synthesising multiple copies of a RNA target sequence. The method comprises combining the target with a primer which hybridises to the 3'-portion of the DNA primer extension prod., reverse transcriptase, RNase I and transcriptase. It can be used as a component of an assay to detect forensic samples. It also has the advantages of being autocatalytic, transcriptase and avoids repetitive manipulations of reaction conditions e.g. temp., ionic strength and pH. (Updated on 25-MAR-2003 to correct pefficial 1) in process.
                                                                                                                                                                                                                                                                                                                                                         Auto-catalytic synthesis of multiple copies of an RNA target sequence - uses cooperative action of a DNA and RNA polymerase in presence of RNase H, useful for detection of target sequence e.g. in clinical or

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       AAQ86607-09 are primers and a probe for the human immunodeficiency virus regulon 1. They are used to produce autocatalytic oligonucleotides which require no change in the experimental conditions i.e.constant temperature, pH and ionic strength. These sequences are useful in generating multiple copies of specific nucleic acid target sequences. (Updated on 25-MAR-2003 to correct pF field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          25-MAR-2003

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               S
                                                                                                                This invention describes a novel method for the autocatalytic amplification of an RNA target in a transcription-based amplification system without thermalcycling. The method generates oligonuclectides for cloning. Typical applications are the detection of genetic or infectious diseases, the monitoring of responses to therapy, the quantitation or detection of microorganisms in foods, forensic studies and the provide many copies of selected RNA targets under conditions of constant temperature, ionic strength and ph. Specific amplification of RNA targets increases sensitivity, convenience, accuracy and the reliability of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Matches

The invention is used for environmental testing, diagnostic testing, research studies and for the preparation of reagents or materials for cloning or other purposes. The present sequence is HIV region specific
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Claim 13;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New oligonucleotide probe, useful in detecting HIV nucleic acid sample and for environmental and diagnostic testing.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Kacian

The invention also comprises a labeled oligonucleotide that specifically hybridises to an HIV-1 sequence derived from gag or pol sequences, having one of the sequences fully defined in the specification, and a method for detecting HIV-1 in a biological sample, comprising mixing the sample with two or more of the amplification oligomers that specifically amplify at least one HIV-1 target sequence within gag and a pol sequence which is a protease or reverse transcriptase sequence, amplifying the target, and detecting the amplified product. The oligonucleotides of the invention may be used to diagnose HIV-1 infection. The presents sequence represents a PCR primer used to amplify the HIV-1 protease gene in the HIV detection method of the invention. (Updated on 29-AUG-2003 to standardise OS field)
                                                                                                                                                                                                             HIV-1;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New nucleic acid oligomers

The present invention is concerned with the detection of nucleic acid markers for prostate and breast cancer, and PCR primers and probes which are able to detect and quantify these markers. Prostate specific antigen (PSA), prostate-specific membrane antigen (PSMA) and glandular kallikrein -2 (hK2) have all been linked to prostate and breast cancers, and the primers and probes of the invention are able to detect the abnormal presence of mRNA expressed by their coding sequences in tissues other
                                                                                                          Detecting prostate-specific antigen (PSA), prostate specific membrane antigen (PSMA) or human kallikrein 2 (hK2) nucleic acids in samples using probe molecules, useful for the diagnosis of prostate and breast cancers.
                                                                                                  Claim 1; Page 13;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present invention provides a number of nucleic acid oligomers which can be used to amplify the gag and pol genes of human immunodeficiency virus type I (HIV-1). These are used to detect regions of the gag and pol genes, especially regions associated with drug resistance, and also for identifying genetic subtypes of the virus. The present sequence is an oligomer of the invention. (Updated on 29-AUG-2003 to standardise os

                                                                                                The present sequence is a PCR primer used in the amplification of the Mycobacterium avium subsp. paratuberculosis 23S rRNA gene. This gene contains several mutations when compared to other Mycobacterium avium subspecies, and some are unique enough to allow the development of a probe which enables specific identification of the presence of paratuberculosis. The organism is responsible for Johne's disease in runinants, especially cows, and is possibly transmitted to humans where it may lead to Crohn's disease. Efficient detection of the bacterium, using a probe designed using this sequence, can be used to identify infected animals so that they can be removed from the herd and destroyed

The oligos are substantially complementary to a sequence of the long terminal repeat (LTR) region of a nucleic acid sequence of a HIV genome. The invention provides a method for detection of HIV-1 nucleic acid using these sequences. Unlike prior art primers and probes, these oligos can detect all known subtypes of HIV-1 with high sensitivity and accuracy
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New oligonucleotide primers and probes complementary to the LTR region HIV-1 - useful for amplification and detection of HIV-1 infections.
                                                                                                                                                                                                                                                                                                                                                                     Sequence 47
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Claim 2; Page 23; 30pp; English.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Goudsmit J,

                                                                                                                                                       The present invention relates to detecting and quantifying a nucleic acid in at least one sample comprising administraring the sample to a solid carrier capable of at least in part absorbing the sample and providing at least a representative part of the carrier to a nucleic acid isolation solution to extract a representative amount of the nucleic acid from the carrier. The method is particularly useful for detecting viral nucleic acid, especially retroviral nucleic acid, in a sample such as a body fluid. The present sequence represents a primer of the invention.
                                                                                                                                                                                                                                                                                                                                              Detecting and quantifying a nucleic acid in a sample, useful for detecting viral RNA, comprises administering the sample to a carrier, exposing the carrier to nucleic acid isolation solution to extract an amount of nucleic acid.

/ Clone lib="119 - RescueMu Grid ABMHI, Site_2: BgIII,
RescueMu is a 4.9 kb, modified maize Mu transposon
designed to allow plasmid rescue from total genomic DNA.
Mu elements insert preferentially into transcription
Mu elements insert preferentially into transcription
units. For more information on RescueMu, go to the web
site 'www.zmdb.iastate.edu' and follow the links for
'RescueMu.' Grid AA was grown at UC San Diego in 2002. DNA
Was extracted from laef strips, double digested using
DH10B cells were transformed and then screened on LB
plates with ampicillin."

RescueMu is a 4.9 kb, modified maize Mu transposon
designed to allow plasmid rescue from total genomic DNA.
Mu elements insert preferentially into transcription
units. For more information on RescueMu, go to the web
site 'www.zmdb.iastate.edu' and follow the links for
'RescueMu.' Grid AA was grown at UC San Diego in 2002. DNA
was extracted from leaf strips, double digested using
BamHI and BglII, and ligated to form circular plasmids.
DH10B cells were transformed and then screened on LB
plates with ampicillin."

Six adult male worms of Onchocerca volvulus were isolated from consenting patients and quick frozen. Adult male mRNA was converted to double-stranded cDNA using reverse transcriptase and oligo(dT) followed by RNase H and DNA pol I. The library has 2 x 10E5 independent recombinants and the average insert size is ~1100bg. The library was constructed by Michelle Lizotte-Waniewski with worms provided by Dr. Sara Lustigman. The library is available from Dr. Steven A. Williams, email: genome@smith.edu."

//Clone_lib="1119 - RescueMu Grid AA"
//note="Organ: leaf; Vector: RescueMu (engineered from pBlueScript backbone); Site 1: BamHI; Site_2: BgIII;
RescueMu is a 4.9 kb, modified maize Mu transposon
designed to allow plasmid rescue from total genomic DNA.
Mu elements insert preferentially into transcription
units. For more information on RescueMu, go to the web
site 'www.zmdb.iastate.edu' and follow the links for
'RescueMu.' Grid AA was grown at UC San Diego in 2002. DNA
was extracted from leaf strips, double digested using
BamHI and BgIII, and ligated to form circular plasmids.
DH10B cells were transformed and then screened on LB

/lab_host="E.coli XL1-Blue mrf'"
/clone lib="Zebrafish Embryonic Heart cDNA Library"
/clone rogan: heart; Vector: Lambda ZAP Express; Site_1:
EccRI; Site_2: XhoI; mRNA was purified from embryonic
zebrafish hearts (3 day post-fertilization). cDNA was
synthesized using a XhoI-Oligo dr adaptor primer. EcoRI
adaptors were ligated, followed by digestion with XhoI,
for directional cloning into pre-digested lambda ZAP
Express vector. "
